BRIEF SUMMARY OF THE INVENTION

My invention "Dry&Free" is a product for excessive sweating or hyperhidrosis. It is a thin, cotton sheet containing odor-absorbing substances and anti-perspirants with an adhesive (sticky) backing that will be placed in the armpit area of shirts to absorb sweat and prevent underarm odor.

People who suffer from hyperhidrosis purchase strong deodorants to prevent odor and excessive sweating, but the problem with existing products is that once a person begins sweating the deodorant comes off. Once the deodorant is gone, there is no longer the odor protection. With "Dry&Free" people can sweat excessively and it won't affect the odor fighting substances and anti-perspirants contained in the thin cotton sheet. No matter how much they sweat, they will be protected because the cotton sheet will be stuck to the inside of the shirt of their underarm where it will be in close connect to their armpit. And they won't have to worry about embarrassing wet stains in their armpit area since their sweat is being absorbed into the cotton sheet.

BRIEF DESCRIPTION OF THE DRAWINGS

None filed

DETAILED DESCRIPTION

"Dry&Free" is an improvement over existing products for hyperhidrosis. Deodorant and an antiperspirant will be applied to the outside layer of a thin, cotton sheet with an overall thickness of approximately five sheets of paper. The cotton will absorb sweat from the armpits at the same time the top layer containing the deodorant/antiperspirant will provide the needed odor protection. An adhesive will be applied to the bottom of the thin, cotton sheet so that it will stay firmly in place – in the underarm area of the inside of a shirt. When an individual places "Dry&Free" inside his shirt, he will first press his hand firmly underneath his armpit so that the deodorant/antiperspirant rubs off into his armpit.

Essentially "Dry&Free" is an underarm deodorant pad or liner. It will hopefully prevent unwanted stains and provide all day odor protection.
